

Introduction

Discrete Mathematics
Andrei Bulatov

Discrete Mathematics - Introduction

1-2

Course Info

● Instructor: Andrei Bulatov

- Email: abulatov@sfu.ca
- Room: TASC 8013
- Office hours (tentative):
 - Wednesday 2:00 – 2:00 (from Sept 1th)
 - Monday 2:00 – 4:00 (from Sept 22th)

● Teaching Assistants:

- Yu Yang, email: yya119@sfu.ca
- Shengdong Zhang, email: sza75@sfu.ca
- Maryam Hayati, email: maryam.hayati@gmail.com

● Course webpage

- <http://www.cs.sfu.ca/CourseCentral/101.MACM/abulatov>

Discrete Mathematics - Introduction

1-3

Course Info

● Course objective:

To introduce basic concepts and applications of discrete mathematics.

● Syllabus:

- Logic and Formal Reasoning
- Set Theory, Functions and Relations
- Mathematical Induction
- Combinatorics
- Number Theory
- Graphs and Trees (if time permits)

Discrete Mathematics - Introduction

1-4

Course Info

● Textbook:

R. P. Grimaldi, *Discrete and Combinatorial Mathematics (an Applied Introduction)*, Addison-Wesley, 2004.

- It is impossible to finish studying all the contents of the textbook in one semester. The contents not covered in lectures/slides are not required.
- The content and order of topics, as presented in the class, do not one-to-one correspond to any part of the book. Use of Subject Index is advised.
- In few cases the notation and terminology in the class differs from that in the book

Discrete Mathematics - Introduction

1-5

Course Info

● References:

- H. Enderton, *A Mathematical Introduction to Logic*, Harcourt/Academic Press, 2001

Discrete Mathematics - Introduction

1-6

Course Info

● Grading:

- 10 Tutorials attendance ($10 \times 1\%$)
- 5 Assignments ($5 \times 5\%$)
- 2 Midterms ($2 \times 15\%$)
- 1 Final Exam 35%

Course Info

Previous results:

Prerequisites

- Not much of specific knowledge
- Some general knowledge is needed, as there will be examples
- Modest math erudition (e.g., 5th Euclid's postulate, see next slide)
- Basics

$$2 \times 2 = 4$$

$$7 \times 8 = 56$$

Two Mathematics

Continuous Mathematics

- Fifth Euclid's Postulate

- Intermediate value theorem

Continuous Mathematics (cntd)

- Laws of Physics

$$\vec{F} = m \frac{d^2 \vec{X}}{dt^2} \quad \text{Newton's second law of motion}$$

$$\nabla \times \vec{E} = \frac{\partial \vec{B}}{\partial t} \quad \text{Maxwell's law of electromagnetism}$$

- Disciplines: geometry, calculus, differential equations, topology, ...
- Applications: physics, engineering, astronomy, ...

Discrete Mathematics

- Discrete Mathematics comprises all branches of mathematics that do not use the idea of continuity.

- 'Formal' definition (Wikipedia):

Discrete mathematics, sometimes called **finite mathematics**, is the study of mathematical structures that are fundamentally discrete, in the sense of not supporting or requiring the notion of continuity. Most, if not all, of the objects studied in finite mathematics are countable sets, such as the integers.

For contrast, see continuum, topology, and mathematical analysis

Discrete Mathematics (cntd)

- Removing continuity

- Discrete fifth Euclid's Postulate (???)

- Graphs

Discrete Mathematics (cntd)

Asymptotics

Properties of a discrete objects are 'approximated' using a continuous function

Laws of discrete mathematics:

$$((\forall x F(x) \rightarrow G(x)) \wedge F(a)) \rightarrow G(a)$$

The rule of universal specification

$X^n + Y^n = Z^n$ does not hold for any $n > 2$ and integer X, Y, Z
Great Fermat's Theorem

Topics in DM

- Wikipedia says that Discrete mathematics usually includes:
 - logic - a study of reasoning
 - set theory - a study of collections of elements
 - number theory
 - combinatorics - a study of counting
 - graph theory
 - algorithmics - a study of methods of calculation
 - information theory
 - the theory of computability and complexity - a study on theoretical limitations on algorithms ...
 - algebra – a study of algebraic systems (Bulatov)
 - discrete probability theory (Grimaldi)

This is too much for us !!

CS at SFU:

MATH-232 Elementary linear algebra	CMPT-477 Introduction to formal verification
CMPT-413 Computational linguistics	CMPT-705 Design and analysis of algorithms
CMPT-379 Principles of compiler design	CMPT-706 Parallel algorithms
CMPT-384 Symbolic computing	CMPT-710 Computational complexity
CMPT-307 Data structures and algorithms	CMPT-725 Logical methods in computational intelligence
CMPT-308 Computability and complexity	CMPT-813 Computational geometry
CMPT-405 Design and analysis of computing algorithms	CMPT-815 Algorithms of optimization
CMPT-406 Computational geometry	CMPT-816 Theory of communication networks
CMPT-407 Computational complexity	CMPT-721 Knowledge representation and reasoning
CMPT-408 Theory of computer networks / communications	CMPT-814 Algorithmic graph theory
MACM-300 Introduction to formal languages and automata	
MACM-401 Symbolic computation	

Our goal

is to learn basic concepts and terminology that provide basis and common language for those and many other courses.

Logic

● Formal logic, syllogisms

Aristotle
384 - 322 B.C.

● Mathematical logic, formal reasoning

George Boole
1815 - 1864

● Computational logic, formal verification

Pentium FDIV bug
1994

● Other applications: artificial intelligence, robotics, software verification, automated theorem proving, ...

Set theory

● Naïve set theory

Georg Cantor
1845 - 1918

● Axiomatic set theory

Bertrand Russell
1872 - 1970

Graphs

- Toy graph theory
Königsberg 7-bridge problem

- Other applications: modeling of nearly everything, electric circuits, networking, linguistics, data storage, coding theory, games, scheduling, combinatorial algorithms, ...

- One more face

Leonard Euler
1707 - 1783

Paul Erdős
1913 - 1996

Number Theory

- Arithmetic (*Arithmetica*)

?

Diophantus
200 - 284

- Number theory

Pierre de Fermat
1608 - 1672

- Algebraic geometry

Andrew Wiles
1953 - ?

- Other applications: cryptography
